

### GENERAL DESCRIPTION

The SGM2200H series is a set of low power high voltage regulators implemented in CMOS technology. These devices allow input voltages as high as 36V. The SGM2200H series is available in several fixed and adjustable output voltages. CMOS technology ensures low dropout voltage and low quiescent current.

Although designed primarily as fixed voltage regulators, these devices can be used with external components to obtain variable voltages and currents.

The SGM2200H series is available in Green SOT-89-3, SOT-23, TSOT-23-5 and SC70-5 packages. It operates over an ambient temperature range of -40°C to +85°C.

### FEATURES

- Low Power Consumption
- Low Dropout Voltage
- High Input Voltage (up to 36V)
- Output Voltage Tolerance:  $\pm 2.5\%$
- Fixed Output Voltage Versions: 0.8V to 5.0V with 0.1V per Step
- Adjustable Output Voltages: 0.8V to 5.0V
- -40°C to +85°C Operating Temperature Range
- Available in Green SOT-89-3, SOT-23, TSOT-23-5 and SC70-5 Packages

### APPLICATIONS

Battery-Powered Equipment  
Communication Equipment  
Audio/Video Equipment

**OVERSTRESS CAUTION**

Stresses beyond those listed may cause permanent damage to the device. Functional operation of the device at these or any other conditions beyond those indicated in the operational section of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

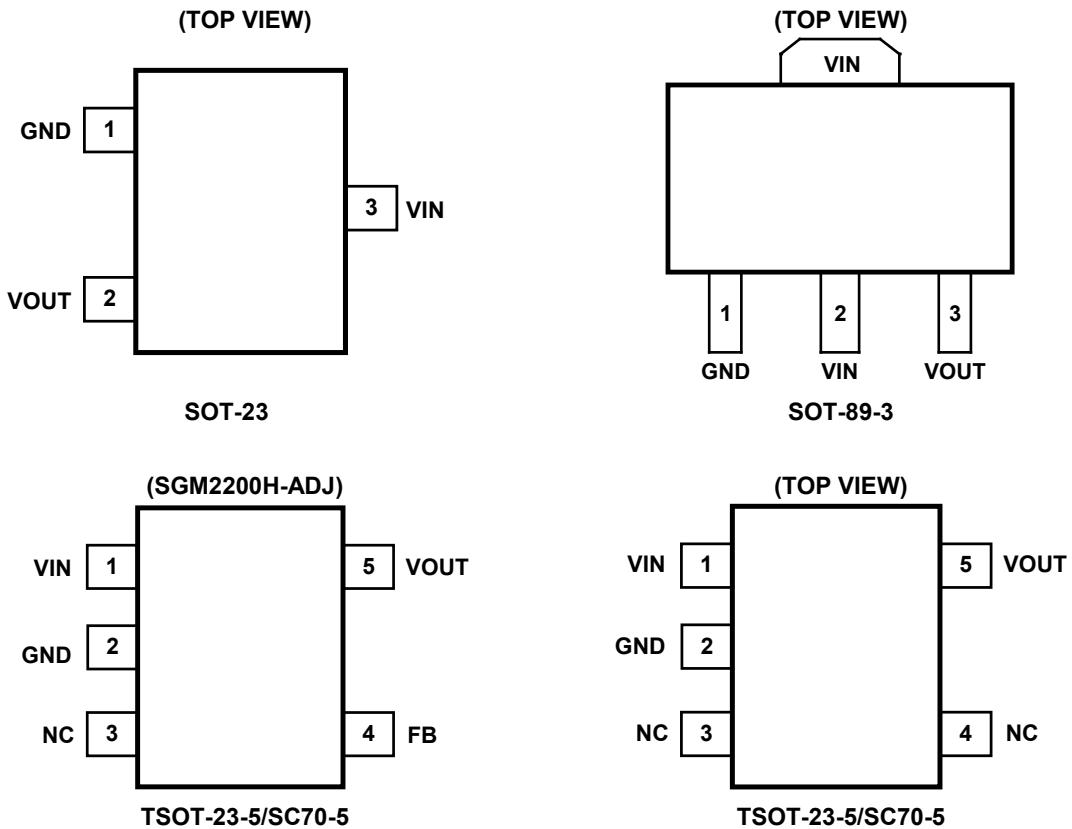

**ESD SENSITIVITY CAUTION**

This integrated circuit can be damaged by ESD if you don't pay attention to ESD protection. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## NOTES:

1. Maximum output current is affected by the PCB layout, size of metal trace, the thermal conduction path between metal layers, ambient temperature and the other environment factors of system. Attention should be paid to the dropout voltage when V<sub>IN</sub> < V<sub>OUT</sub> + V<sub>DROP</sub>.
2. The dropout voltage is defined as V<sub>IN</sub> - V<sub>OUT</sub>, when V<sub>OUT</sub> is 95% of the value of V<sub>OUT</sub> for V<sub>IN</sub> = V<sub>OUT</sub> + 2V.
3. Output voltage temperature coefficient is defined as the worst-case voltage change divided by the total temperature range.

## DETAILED DESCRIPTION

The SGM2200H series is a linear regulator designed primarily for high input voltage applications. The SGM2200H series is available in several fixed output voltages and adjustable from 0.8V to 5.0V with a simple resistor divider. The maximum output current is dependent on the package's maximum power dissipation for a given temperature.

The SGM2200H series is available in adjustable and several fixed output voltages. CMOS technology ensures low dropout voltage and low quiescent current.

The SGM2200H uses external feedback, allowing the user to set the output voltage with an external resistor divider. The typical FB pin voltage is 0.8V.

## APPLICATION INFORMATION

### Setting the Output Voltage

Set the output voltage of the SGM2200H by using a resistor divider as shown:

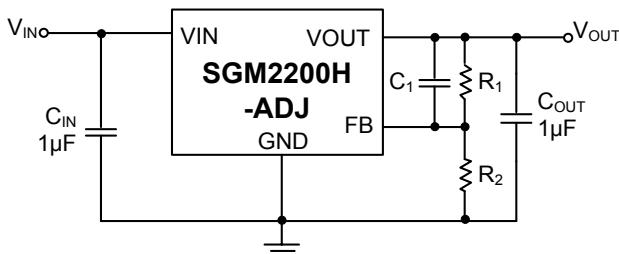

Figure 3. SGM2200H-ADJ with External Resistor Divider

Choose  $R_2 = 2\text{M}\Omega$  to maintain a  $0.4\mu\text{A}$  minimum load. Calculate the value for  $R_1$  using the following equation:

$$R_1 = R_2 \times \left( \frac{V_{OUT}}{0.8V} - 1 \right)$$

### Input Capacitor and Output Capacitor

For proper operation, place a ceramic capacitor ( $C_{IN}$ ) between  $1\mu\text{F}$  and  $10\mu\text{F}$  between the input pin and ground. Larger values in this range will help improve line transient response.

For stable operation, use a ceramic capacitor ( $C_{OUT}$ ) between  $1\mu\text{F}$  and  $10\mu\text{F}$ . Larger values in this range will help improve load transient response and reduce noise. Output capacitors of other dielectric types may be used, but are not recommended as their capacitance can deviate greatly from their rated value over temperature.

### Thermal Considerations

When the junction temperature is too high, the thermal protection circuitry sends a signal to the control logic that will shutdown the IC. The IC will restart when the temperature has sufficiently cooled down.

The maximum power dissipation is dependent on the thermal resistance of the case and the circuit board, the temperature difference between the die junction and the ambient air, and the rate of air flow.

### Output Noise

The SGM2200H will exhibit noise on the output during normal operation. This noise is negligible for most applications. However, in applications that include analog-to-digital converters (ADCs) of more than 12 bits, one needs to consider the ADC's power supply rejection specifications. The feed forward capacitor  $C_1$  across  $R_1$  will significantly reduce the output noise.
