

# SGM8557-1/SGM8557-2/SGM8557-3/SGM8557-5

## 15MHz, High Output Drive, High Precision, Low Noise Operational Amplifiers

### GENERAL DESCRIPTION

The SGM8557-1 (single), SGM8557-3 (single with shutdown), SGM8557-2 (dual) and SGM8557-5 (dual with shutdown) high output drive CMOS operational amplifiers feature a peak output current of 240mA, rail-to-rail output capability from a single 2.7V to 5.5V supply. These amplifiers exhibit a high slew rate of 7V/ $\mu$ s and a gain-bandwidth product (GBP) of 15MHz. The SGM8557-3/5 offer a shutdown feature that drives the output low.

The SGM8557-1/2/3/5 offer low input offset voltage, low input offset voltage drift, wide bandwidth and high output drive.

The SGM8557-1 is available in Green SOIC-8, MSOP-8 and SOT-23-5 packages. The SGM8557-2 is available in a Green SOIC-8 package. The SGM8557-3 is available in Green SOIC-8 and SOT-23-6 packages. The SGM8557-5 is available in a Green MSOP-10 package. They operate over an ambient temperature range of -40°C to +125°C.

### APPLICATIONS

Portable/Battery-Powered Audio Applications  
Audio Hands-Free Car Phones (Kits)  
Laptop/Notebook Computers/TFT Panels  
Sound Ports/Cards  
Set-Top Boxes  
Digital-to-Analog Converter Buffers  
Transformer/Line Drivers  
Motor Drivers

### FEATURES

- **240mA Output Drive Capability**
- **Rail-to-Rail Output**
- **Low Input Offset Voltage: 5 $\mu$ V (MAX)**
- **Low Input Offset Voltage Drift: 27nV/°C (TYP)**
- **Low Noise: 22nV/ $\sqrt{\text{Hz}}$  at 1kHz**
- **Over-Temperature Protection**
- **Supply Voltage Range: 2.7V to 5.5V**
- **Quiescent Supply Current:**
  - **1.2mA/Amplifier (TYP)**
  - **0.3 $\mu$ A Shutdown Current for SGM8557-3/5 (TYP)**
- **Gain-Bandwidth Product: 15MHz**
- **High Slew Rate: 7V/ $\mu$ s**
- **Voltage Gain ( $R_L = 2\text{k}\Omega$ ): 144dB**
- **Power Supply Rejection Ratio: 120dB**
- **No Phase Reversal for Overdriven Inputs**
- **Small Packaging:**
  - **SGM8557-1 Available in Green SOIC-8, MSOP-8, and SOT-23-5 Packages**
  - **SGM8557-2 Available in a Green SOIC-8 Package**
  - **SGM8557-3 Available in Green SOIC-8 and SOT-23-6 Packages**
  - **SGM8557-5 Available in a Green MSOP-10 Package**

### TYPICAL OPERATING CIRCUIT

# SGM8557-1/SGM8557-2 SGM8557-3/SGM8557-5

# 15MHz, High Output Drive, High Precision, Low Noise Operational Amplifiers

## PACKAGE/ORDERING INFORMATION

| MODEL     | PACKAGE DESCRIPTION | SPECIFIED TEMPERATURE RANGE | ORDERING NUMBER    | PACKAGE MARKING            | PACKING OPTION      |
|-----------|---------------------|-----------------------------|--------------------|----------------------------|---------------------|
| SGM8557-1 | SOIC-8              | -40°C to +125°C             | SGM8557-1XS8G/TR   | SGM<br>85571XS8<br>XXXXX   | Tape and Reel, 2500 |
|           | MSOP-8              | -40°C to +125°C             | SGM8557-1XMS8G/TR  | SGM85571<br>XMS8<br>XXXXX  | Tape and Reel, 4000 |

Date Code - Week  
Date Code - Year

Green (RoHS & HSF): SG Micro Corp defines "Green" to mean Pb-Free (RoHS compatible) and free of halogen substances. If you have additional comments or questions, please contact your SGMICRO representative directly.

## ABSOLUTE MAXIMUM RATINGS

Supply Voltage, +Vs to -Vs.....6V  
All Other Pins..... (-Vs) - 0.3V to (+Vs) + 0.3V  
Output Short-Circuit Duration to +Vs or -Vs.....10s  
Junction Temperature.....+150°C  
Storage Temperature Range.....-65°C to +150°C  
Lead Temperature (Soldering, 10s).....+260°C  
ESD Susceptibility  
HBM.....7000V  
MM.....400V  
CDM.....1000V

## OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

## RECOMMENDED OPERATING CONDITIONS

Operating Temperature Range.....-40°C to +125°C  
Operating Supply Voltage Range.....2.7V to 5.5V

## ESD SENSITIVITY CAUTION

This integrated circuit can be damaged by ESD if you don't pay attention to ESD protection. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## DISCLAIMER

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

**APPLICATION INFORMATION**

**60mW Single-Supply Stereo Headphone Driver**

The SGM8557-2 can be used as a single-supply, stereo headphone driver. The circuit shown in Figure 1 can deliver 60mW per channel with 1% distortion from a single 5V supply.

**Figure 1. Circuit Example: A Single-Supply, Stereo Headphone Driver**

The input capacitor ( $C_{IN}$ ), in conjunction with  $R_{IN}$ , forms a high-pass filter that removes the DC bias from the incoming signal. The -3dB point of the high-pass filter is given by:

$$f_{-3dB} = \frac{1}{2\pi R_{IN} C_{IN}}$$

Choose gain-setting resistors  $R_{IN}$  and  $R_F$  according to the amount of desired gain, keeping in mind the maximum output amplitude. The output coupling capacitor ( $C_{OUT}$ ), blocks the DC component of the amplifier output, preventing DC current flowing to the load. The output capacitor and the load impedance form a high-pass filter with the -3dB point determined by:

$$f_{-3dB} = \frac{1}{2\pi R_L C_{OUT}}$$

For a 32Ω load, a 100μF aluminum electrolytic capacitor gives a low-frequency pole at 50Hz.

**Rail-to-Rail Output Stage**

The minimum output is within millivolts of ground for single-supply operation, where the load is referenced to ground ( $-V_S$ ). The maximum output voltage swing is load dependent.

Observe the Absolute Maximum Ratings for power dissipation and output short-circuit duration because the output current can exceed 240mA.

**Bridge Amplifier**

The circuit shown in Figure 2 uses an SGM8557-2 to implement a 3V, 200mW amplifier suitable for use in size-constrained applications. This configuration eliminates the need for the large coupling capacitor required by the single operational amplifier speaker driver when single-supply operation is necessary. Voltage gain is set to 10V/V; however, it can be changed by adjusting the 82kΩ resistor value.

**Figure 2. SGM8557-2 Bridge Amplifier for 200mW at 3V**

**APPLICATIONS INFORMATION (continued)**

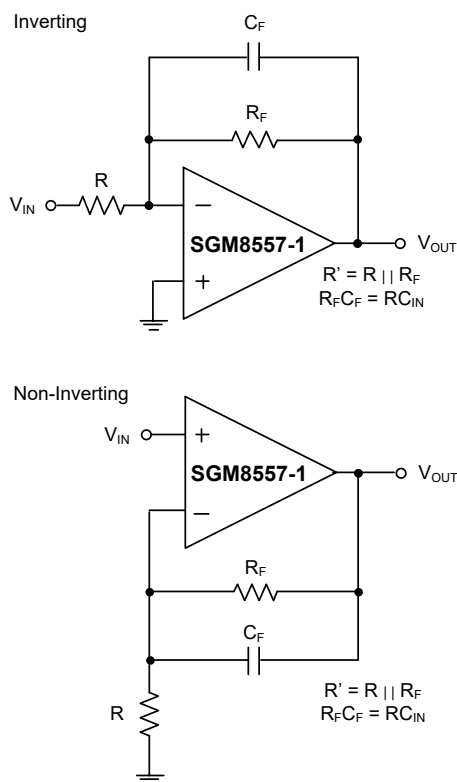

**Input Capacitance**

One consequence of the parallel-connected differential input stages is a relatively large input capacitance  $C_{IN}$  (20pF TYP). This introduces a pole at frequency  $(2\pi R' C_{IN})^{-1}$ , where  $R'$  is the parallel combination of the gain-setting resistors for the inverting or non-inverting amplifier configuration (Figure 3). If the pole frequency is less than or comparable to the unity-gain bandwidth (15MHz), the phase margin is reduced, and the amplifier exhibits degraded AC performance through either ringing in the step response or sustained oscillations. The pole frequency is 10MHz when  $R' = 2k\Omega$ . To maximize stability,  $R' \ll 2k\Omega$  is recommended.

To improve step response when  $R' > 2k\Omega$ , connect small capacitor  $C_F$  between the inverting input and output. Choose  $C_F$  as follows:

$$C_F = 8(R/R_F) \text{ [pF]}$$

where  $R_F$  is the feedback resistor and  $R$  is the gain-setting resistor (Figure 3).

**Figure 3. Inverting and Non-Inverting Amplifiers with Feedback Compensation**

**Driving Capacitive Loads**

The SGM8557-1/2/3/5 have a high tolerance for capacitive loads. They are stable with capacitive loads up to 780pF. Figure 4 shows the transient response with capacitive loads (780pF), with and without the addition of an isolation resistor in series with the output. Figure 5 shows a typical non-inverting capacitive-load-driving circuit in the unity-gain configuration.

The resistor improves the circuit's phase margin by isolating the load capacitor from the operational amplifier's output.

**Figure 4. Small-Signal Transient Response with Capacitive Load**

**Figure 5. Capacitive-Load-Driving Circuit**

## APPLICATIONS INFORMATION (continued)

### Power-Up and Shutdown Modes

The SGM8557-3/5 have a shutdown option. When the shutdown pin ( $\overline{\text{SHDN}}$ ) is pulled low, supply current drops to  $0.3\mu\text{A}$  per amplifier ( $V_S = 5\text{V}$ ), the amplifiers are disabled, and their outputs are driven to  $-V_S$ . Since the outputs are actively driven to  $-V_S$  in shutdown, any pull-up resistor on the output causes a current drain from the supply. Pulling  $\overline{\text{SHDN}}$  high enables the amplifier. In the dual SGM8557-5, the two amplifiers shut down independently. Figure 6 shows the SGM8557-3's output voltage to a shutdown pulse. The SGM8557-1/2/3/5 typically settle within  $5\mu\text{s}$  after power-up.

When exiting shutdown, there is a  $6\mu\text{s}$  delay before the amplifier's output becomes active (Figure 6).

### Power Supplies and Layout

The SGM8557-1/2/3/5 can operate from a single 2.7V to 5.5V supply, or from dual  $\pm 1.35\text{V}$  to  $\pm 2.75\text{V}$  supplies. For single-supply operation, bypass the power supply with a  $0.1\mu\text{F}$  ceramic capacitor. For dual-supply operation, bypass each supply to ground. Good layout improves performance by decreasing the amount of stray capacitance at the operational amplifiers' inputs and outputs. Decrease stray capacitance by placing external components close to the operational amplifiers' pins, minimizing trace and lead lengths.
