

SGM4553 2-Bit Bidirectional Voltage-Level Translator for Open-Drain and Push-Pull Applications

GENERAL DESCRIPTION

This two-bit non-inverting translator is a bidirectional voltage-level translator and can be used to establish digital switching compatibility between mixed-voltage systems. It uses two separate configurable power-supply rails, with the A ports supporting operating voltages from 1.65V to 5.5V while it tracks the $V_{\rm CCA}$ supply, and the B ports supporting operating voltages from 2.3V to 5.5V while it tracks the $V_{\rm CCB}$ supply. This allows the support of both lower and higher logic signal levels while providing bidirectional translation capabilities between any of the 1.8V, 2.5V, 3.3V, and 5V voltage nodes.

When the output-enable (OE) input is low, all I/Os are placed in the high-impedance state, which significantly reduces the power-supply quiescent current consumption. OE has an internal pull-down current source, as long as $V_{\rm CCA}$ is powered.

To ensure the high-impedance state during power up or power down, OE should be tied to GND through a pull-down resistor; the minimum value of the resistor is determined by the current-sourcing capability of the driver.

The SGM4553 is available in the Green SOT-23-8 and XTDFN-1.4×1-8L packages. It operates over an ambient temperature range of -40°C to +85°C.

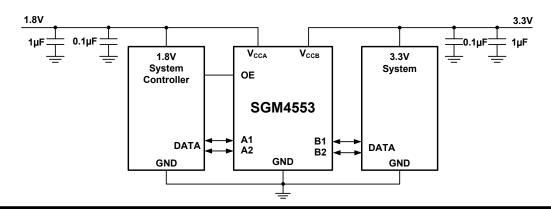

FEATURES

- No Direction-Control Signal Needed
- Data Rates
 24Mbps (Push-Pull)
 2Mbps (Open-Drain)
- 1.65V to 5.5V on A Ports and 2.3V to 5.5V on B Ports (V_{CCA} ≤ V_{CCB})
- V_{CC} Isolation: If Either V_{CC} is at GND, Both Ports are in the High-Impedance State
- No Power-Supply Sequencing Required:
 Either V_{CCA} or V_{CCB} can be Ramped First
- I_{OFF}: Supports Partial-Power-Down Mode Operation
- Available in Green SOT-23-8 and XTDFN-1.4×1-8L Packages

APPLICATIONS

I²C/SMBus UART GPIO

TYPICAL APPLICATION CIRCUIT

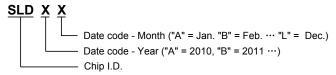

PACKAGE/ORDERING INFORMATION

MODEL	PACKAGE DESCRIPTION	ORDERING NUMBER	PACKAGE MARKING	PACKAGE OPTION
SGM4553	SOT-23-8	SGM4553YN8G/TR	SLDXX	Tape and Reel, 3000
3GW4333	XTDFN-1.4×1-8L	SGM4553YXDO8G/TR	N2X	Tape and Reel, 5000

NOTE: X = Date Code, XX = Date Code.

MARKING INFORMATION

For example: SLDDB (2013, February)

ABSOLUTE MAXIMUM RATINGS

V _{CCA} , Supply Voltage Range	0.3V to 6V
V _{CCB} , Supply Voltage Range	0.3V to 6V
V _I , A Ports, B Ports, OE Input Voltage	e Range ⁽²⁾ 0.3V to 6V
Vo, Voltage Range Applied to A	ny Output in the High-
Impedance or Power-Off State (2)	
A Ports	0.3V to 6V
B Ports	0.3V to 6V
Vo, Voltage Range Applied to Any 0	Output in the High or Low
State (2) (3)	
A Ports	0.3V to V _{CCA} + 0.3V
B Ports	0.3V to V _{CCB} + 0.3V
I _{IK} , Input Clamp Current (V _I < 0)	50mA

I _{OK} , Output Clamp Current (V _O < 0)	50mA

Operating Temperature Range	40°C to +85°C
Junction Temperature	150°C
Storage Temperature Range	65°C to +150°C
Lead Temperature (Soldering, 10sec)	260°C
ESD Susceptibility	
HBM	4000V
MM	300V

NOTES:

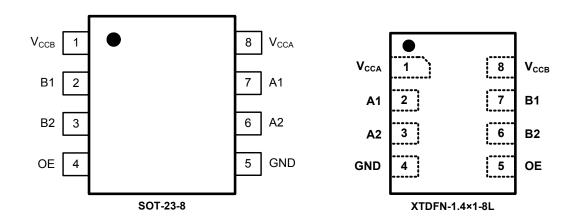

- 1. Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute Maximum rating conditions for extended periods may affect device reliability.
- 2. The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.
- 3. The value of V_{CCA} and V_{CCB} are provided in the recommended operating conditions table.

CAUTION

This integrated circuit can be damaged by ESD if you don't pay attention to ESD protection. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

SGMICRO reserves the right to make any change in circuit design, specification or other related things if necessary without notice at any time. Please contact SGMICRO sales office to get the latest datasheet.

PIN CONFIGURATIONS (TOP VIEW)

PIN DESCRIPTION

PIN		NAME	FUNCTION	
SOT-23-8	XTDFN-1.4×1-8L	NAME	FUNCTION	
1	8	V _{CCB}	B Ports Supply Voltage. $2.3V \le V_{CCB} \le 5.5V$.

APPLICATION INFORMATION

Applications

The SGM4553 can be used to bridge the digital-switching compatibility gap between two voltage nodes to successfully interface logic threshold levels found in electronic systems. It should be used in a point-to-point topology for interfacing devices or systems operating at different interface voltages with one another. Its primary target application use is for interfacing with open-drain drivers on the data I/Os such as I²C or 1-wire, where the data is bidirectional and no control signal is available. The SGM4553 can also be used in applications where a push-pull driver is connected to the data I/Os.

Architecture

The SGM4553 architecture (see Figure 1) is an auto-direction-sensing based translator that does not require a direction-control signal to control the direction of data flow from A to B or from B to A.

These two bidirectional channels independently determine the direction of data flow without a direction-control signal. Each I/O pin can be automatically reconfigured as either an input or an output, which is how this auto-direction feature is realized.

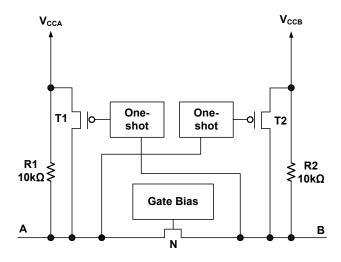

Figure 1. Architecture of an SGM4553 Cell

The SGM4553 employs two key circuits to enable this voltage translation:

- An N-channel pass-gate transistor topology that ties the A port to the B port.
- Output one-shot (O.S.) edge-rate accelerator circuitry to detect and accelerate rising edges on the A or B ports.

Input Driver Requirements

The fall time (t_{fA} , t_{fB}) of a signal depends on the output impedance of the external device driving the data I/Os of the SGM4553. Similarly, the t_{PHL} and data rates also depend on the output impedance of the external driver. The values for t_{fA} , t_{fB} , t_{PHL} , and data rates in the datasheet assume that the output impedance of the external driver is less than 50 Ω .

Power Up

During operation, ensure that $V_{CCA} \le V_{CCB}$ at all times. The sequencing of each power supply will not damage the device during the power up operation, so either power supply can be ramped up first.

Output Load Considerations

We recommend careful PCB layout practices with short PCB trace lengths to avoid excessive capacitive loading and to ensure that proper O.S. triggering takes place. PCB signal trace-lengths should be kept short enough such that the round trip delay of any reflection is less than the one-shot duration. This improves signal integrity by ensuring that any reflection sees a low impedance at the driver. The O.S. circuits have been designed to stay on for approximately 30ns. The maximum capacitance of the lumped load that can be driven also depends directly on the one-shot duration. With very heavy capacitive loads, the one-shot can time-out before the signal is driven fully to the positive rail. The O.S. duration has been set to best optimize trade-offs between dynamic I_{CC}, load driving capability, and maximum bit-rate considerations. Both PCB trace length and connectors add to the capacitance that the SGM4553 output sees, so it is recommended that this lumped-load capacitance be considered to avoid retriggering, bus contention, output oscillations, or other adverse system-level affects.

APPLICATION INFORMATION

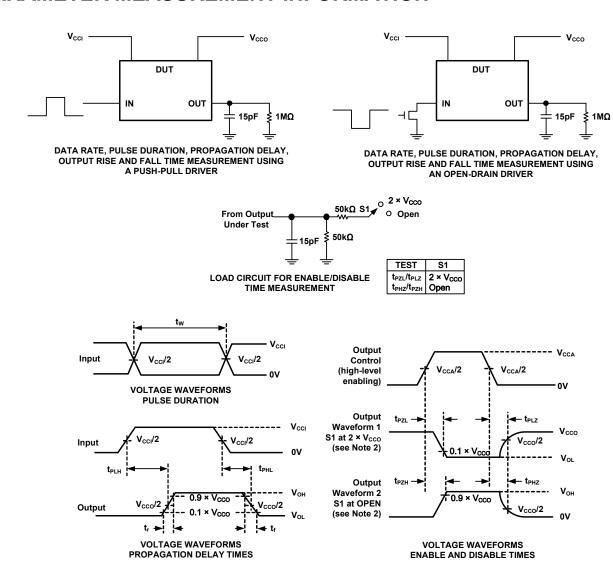

Enable and Disable

The SGM4553 has an OE input that is used to disable the device by setting OE low, which places all I/Os in the Hi-Z state. OE has an internal pull-down current source, as long as V_{CCA} is powered. The disable time (t_{DIS}) indicates the delay between the time when OE goes low and when the outputs are disabled (Hi-Z). The enable time (t_{EN}) indicates the amount of time the user must allow for the one-shot circuitry to become operational after OE is taken high.

Pull-Up or Pull-Down Resistors on I/O Lines

Each A port I/O has an internal $10k\Omega$ pull-up resistor to V_{CCA} , and each B port I/O has an internal $10k\Omega$ pull-up resistor to V_{CCB} . If a smaller value of pull-up resistor is required, an external resistor must be added from the I/O to V_{CCA} or V_{CCB} (in parallel with the internal $10k\Omega$ resistors). Adding lower value pull-up resistors will affect V_{OL} levels, however. The internal pull-ups of the SGM4553 are disabled when the OE pin is low.

PARAMETER MEASUREMENT INFORMATION

NOTES:

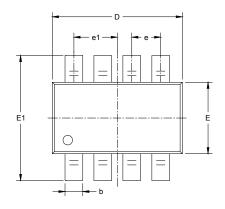

- 1. C_L includes probe and jig capacitance.
- 2. Waveform 1 is for an output with internal conditions such that the output is low, except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high, except when disabled by the output control.
- 3. All input pulses are supplied by generators having the following characteristics: PRR \leq 10MHz, $Z_0 = 50\Omega$, dv/dt \geq 1V/ns.
- 4. The outputs are measured one at a time, with one transition per measurement.
- 5. t_{PLZ} and t_{PHZ} are the same as t_{DIS} .
- 6. t_{PZL} and t_{PZH} are the same as t_{EN} .
- 7. t_{PLH} and t_{PHL} are the same as t_{PD} .
- 8. V_{CCI} is the V_{CC} associated with the input ports.
- 9. V_{CCO} is the V_{CC} associated with the output ports.
- 10. All parameters and waveforms are not applicable to all devices.
