

SGM2541

28V/16V Bidirectional Load Switch with Wireless/Dual Input Capability

GENERAL DESCRIPTION

The SGM2541 is a high-current, low-loss bidirectional load switch and over-voltage protection (OVP) device with wireless/dual input capability.

The device supports up to 20VDC operating input voltage (28VDC withstand) at USBIN pins, and a 16VDC reverse voltage blocking feature at OUT pins. The SGM2541 provides input voltage-clamped protection for input surge events up to 120V. The integrated high-speed input over-voltage protection capability ensures safe operation for surge events that occur during the ON-state (conducting) or OFF-state (non-conducting). The two OVP threshold voltages (17V/13V) can be programmed through VP pin.

A second input and 2:1 power multiplexer can be achieved by connecting a compatible wireless receiver (wireless Rx) output to the load switch OUT pins.

The bidirectional device can detect and support USB-OTG applications. It also includes under-voltage lockout, over-voltage lockout and over-temperature protection circuits designed to automatically isolate the power switch terminals when a fault condition occurs.

The SGM2541 is available in the Green WLCSP-2.43×1.75-20B package. It operates over an ambient temperature range of -40°C to +85°C.

FEATURES

- **Bidirectional Switch for USBIN and OUT to Allow On-The-Go (OTG) Mode**
- **Input Voltage Range:**
3V to 20V at USBIN and 3V to 16V at OUT
- **Programmable OVP Threshold Voltages**
- **28V Tolerance on USBIN Pin**
- **120V Surge Protection**
- **5A Continuous Current from USBIN to OUT**
- **5A Continuous Current from OUT to USBIN in OTG Mode**
- **Low On-Resistance: 28mΩ (TYP)**
- **1.4V Control Logic**
- **Soft-Start to Reduce Input Peak Current**
- **Available in Green WLCSP-2.43×1.75-20B Package**
- **-40°C to +85°C Operating Temperature Range**

APPLICATIONS

Smart Phone

Tablet PC

Mobile Devices with Wireless Charging Options

PACKAGE/ORDERING INFORMATION

MODEL	PACKAGE DESCRIPTION	SPECIFIED TEMPERATURE RANGE	ORDERING NUMBER	PACKAGE MARKING	PACKING OPTION
SGM2541	WLCSP-2.43×1.75-20B	-40°C to +85°C	SGM2541YG/TR	XXXXX 2541YG	Tape and Reel, 3000

NOTE: XXXXX = Date Code and Vendor Code.

Green (RoHS & HSF): SG Micro Corp defines "Green" to mean Pb-Free (RoHS compatible) and free of halogen substances. If you have additional comments or questions, please contact your SGMICRO representative directly.

ABSOLUTE MAXIMUM RATINGS

V_{USBIN_ABSMAX}	28V
V_{USBIN} to V_{OUT} (Differential Input, Blocking).....	28V
V_{OUT} to V_{USBIN} (Differential Input, Blocking).....	16V
V_{OUT_MAX} , V_{USB_SNS}	20V
Control Pin Voltages	6V
Junction Temperature	+150°C
Storage Temperature Range.....	-65°C to +150°C
Lead Temperature (Soldering, 10s)	+260°C

RECOMMENDED OPERATING CONDITIONS

Input Voltage Range	3V to 20V
Operating Temperature Range	-40°C to +85°C

OVERSTRESS CAUTION

Stresses beyond those listed may cause permanent damage to the device. Functional operation of the device at these or any other conditions beyond those indicated in the operational section of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

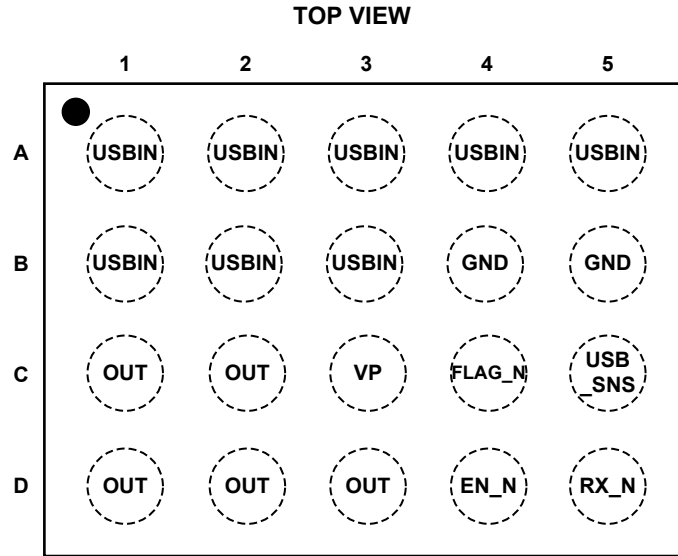

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged by ESD if you don't pay attention to ESD protection. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

DISCLAIMER

SG Micro Corp reserves the right to make any change in circuit design, specification or other related things if necessary without notice at any time.

PIN CONFIGURATION

WLCSP-2.43×1.75-20B

PIN DESCRIPTION

PIN	NAME	FUNCTION
A1 - A5, B1 - B3	USBIN	Power Pin, Load Switch Input Pin. Connect a capacitor from this pin to the GND plane.
B4, B5	GND	Ground Pin. Connect this pin to the external ground plane close to the USBIN decoupling capacitors.
C1, C2, D1 - D3	OUT	Power Pin, Load Switch Output Pin. Connect this pin to the output capacitors, charger input pin, and wireless Rx output node for dual input configurations.
C3	VP	Digital Input. OVP voltage programming pin allows programming of one of two OVP-fast voltage thresholds. Connect the pin to GND to select 17V (TYP). Float the pin to select 13V (TYP).
C4	FLAG_N	Digital I/O Pin. The flag pin is pulled High to indicate to the system when OTG mode can be triggered in autonomous mode. Slave mode: Pull this pin logic Low, or tie to external GND plane. Autonomous mode: Connect to the system digital input/output pin (or equivalent) that pulls logic Low to enter OTG mode when USBIN is connected to an OTG load and a power source is applied to OUT.
C5	USB_SNS	Analog Output Pin. USB_SNS is a Clamped USBIN Sense Pin. In slave mode, connect this pin to the system's input sense pin that can respond to a valid USBIN voltage. This pin is optional in autonomous mode for system diagnostic purposes. An optional ceramic capacitor may be added from this pin to GND, sized as needed.
D4	EN_N	Digital Input Pin. Active Low Logic Enable Pin. Slave mode: Connect this pin to the system's enable logic pin. Autonomous mode: Pull this pin logic Low, or tie it to the external GND plane.
D5	RX_N	Digital I/O Pin. Wireless Rx Active Low Logic Enable Pin. Slave mode: Pull this pin logic Low, or tie to an external GND plane. Autonomous mode: Connect this pin to the wireless Rx active Low enable pin if a system output control pin is not available.

ELECTRICAL CHARACTERISTICS

(V_{USBIN} = 5V, V_{OUT} = 5V, T_A = -40°C to +85°C, typical values are at T_A = +25°C, unless otherwise noted.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Input Voltage Range	V _{USBIN}		3		20	V
Output Voltage Range	V _{OUT}		3		V _{OVP}	V
Input/Output Under-Voltage Lockout	V _{UVLO}			2.8		V
UVLO Hysteresis	V _{UVLO_HYS}			0.5		V
Input Over-Voltage Protection Threshold	V _{OVP}	V _{USBIN} > V _{OVP} enters fault mode; the VP pin is tied to ground.		17		V
		V _{USBIN} > V _{OVP} enters fault mode; the VP pin is floating.		13		V

FUNCTIONAL BLOCK DIAGRAM

Figure 3. Block Diagram

OPERATION

The SGM2541 bidirectional load switch is designed for systems or chargers with high voltage quick charge capability and as well as wireless charging capabilities. The addition of a wireless Rx with an enable/disable pin allows the load switch to implement an equivalent 2:1 power multiplexer (PMUX) as shown in Figure 1. When disabled, the wireless Rx withstand voltage must be greater than or equal to 20V, the load switch’s maximum output operating voltage.

The load switch can transition between the OFF-state/standby-state and ON-state/OTG modes, based on the input devices powered states (USBIN adapter and/or wireless Rx) and logic I/O pins.

PMUX Operating Modes

The 2:1 PMUX can operate in slave or autonomous modes. Slave mode allows the charger (system) to act as a master and determine the input priority, while autonomous mode assigns the input priority to the USBIN power source over the wireless Rx.

Both slave and autonomous modes include a 50ms input debounce delay and 0.8ms in rush periods. Autonomous mode includes a 50ms automatic

break-before-make plus discharge period that is disabled in slave mode by grounding the RX_N pin.

Slave Mode

In slave mode, the charger (system) acts as the master, disables the wireless Rx, and activates the load switch ON-state via the EN_N pin. The slave mode allows the system (charger) to assign the priority of the input power source when both power sources are active.

In slave mode, toggling EN_N pin triggers the standby-state, ON-state, or ON-state/OTG modes. In OTG slave mode, a low input voltage threshold is detected at the USB_SNS pin. Toggling EN_N pin to Low triggers OTG mode, the wireless Rx may be enabled by the charger (system) as follows: the system (charger) that controls OTG concurrent mode requires that the master enable the boost and/or wireless Rx. OTG mode is triggered when the master detects that the necessary conditions are met.

NOTE: Both the FLAG_N and the RX_N pins are tied to GND in slave mode. OTG concurrent mode requires slave mode.

OPERATION (continued)

Input OVP and Reverse Current Blocking

In the OFF-state (non-conducting), the load switch USBIN to ground withstand voltage is at least 28VDC with a reverse blocking voltage of at least 16VDC. In the ON-state (conducting), the load switch maximum V_{USBIN}/V_{OUT} to ground operating voltage is at least 20VDC.

Soft-Start

Bidirectional peak current limiting is provided with a 0.8ms soft-start that occurs during load switch activation. In slave mode, soft-start when a valid EN_N pin is toggled and after the debounce delay is satisfied. In autonomous mode, soft-start when a valid FLAG_N pin is toggled and after the debounce delay and break-before-make plus discharge delay is satisfied.

Input Surge Protection

The device must withstand up to 120V surge voltage applied from the USBIN pin to ground pins. The surge may be applied to the load switch in the ON/OFF-state. The surge waveform is compatible with the IEC

61000-4-5 specification, $R_{SOURCE} = 2.0\Omega$, 1.2/50 μ s waveform.

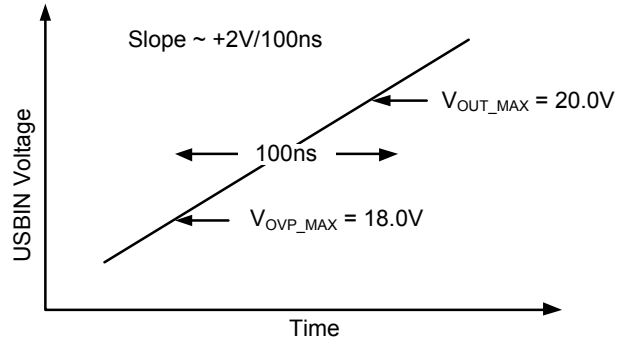

Figure 5. Surge Voltage Waveform with $C_{USBIN} = 1\mu F$ Capacitive Loading

OTG Modes

OTG modes occur after the charger detects an OTG plug-in event, ~5V is applied to the OUT pin, and the USBIN pin is tied to an OTG load. The USB_SNS and EN_N pins are used in slave mode, while the FLAG_N pin is used in autonomous mode as shown in Figure 6.

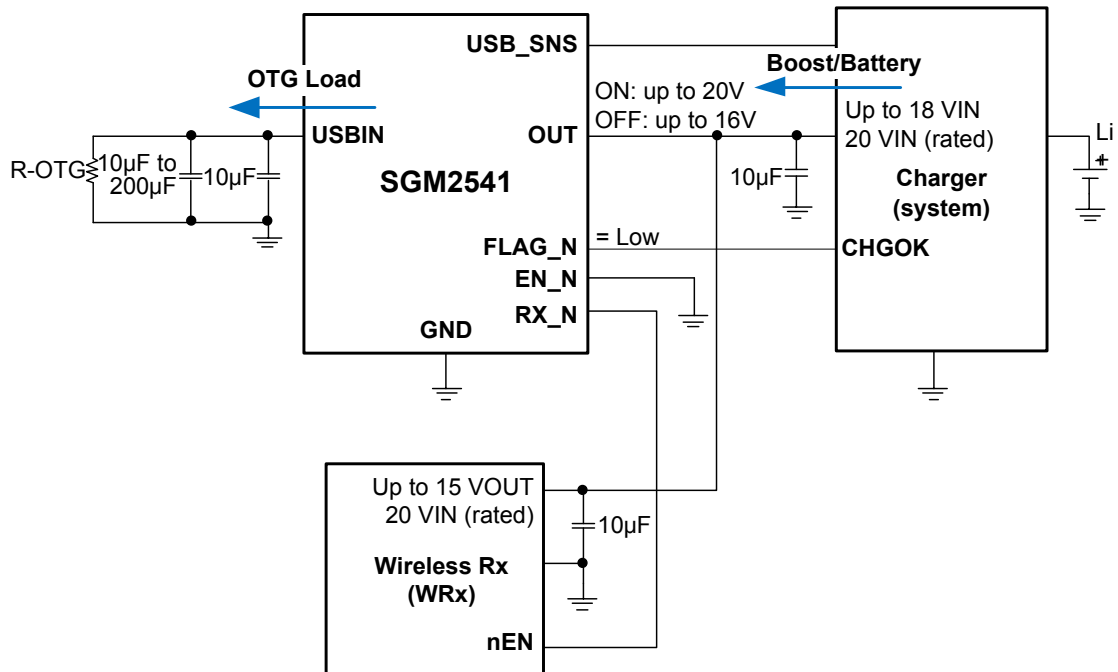

Figure 6. OTG Mode (R-OTG Load Applied to USBIN, Autonomous Mode)

OPERATION (continued)

OTG mode must support $C_{OUT} = 1\mu F$ (static), plus $C_{OTG} = 200\mu F$ that can occur during a hot plug event; see Figure 7.

Figure 7. OTG Cable Capacitive Hot Plug Event (C-Load Applied)

Debounce Period

The valid USBIN detection occurs after a 50ms input debounce period. There is no OUT debounce.

Turn-On Delay and Discharge

In autonomous mode, the USBIN 50ms debounce period is followed by a 50ms break-before-make delay that allows time to disable the device while discharging the wireless Rx output. The break-before-make delay is

also triggered in autonomous mode when $RX_N = High$. These delays are followed by a 0.8ms soft-start to limit peak inrush currents.

A 10mA (or 500kΩ) pull-down at OUT is active during the 50ms break-before-make delay, ensuring that no voltage appears at the output when the ON-state is activated.

The break-before-make delay is inactive when the V_{USBIN} is removed because UVLO is active and the load switch is not powered; see Figure 9.

Timing Diagrams

Figure 8 to Figure 11 show slave and autonomous mode timing diagrams.

In slave mode, the ON/OFF-state of the load switch is determined by the EN_N logic input pin that is tied to the system logic. The wireless Rx ON/OFF-state is determined by an external connection between the system logic and the wireless Rx enable input shown as nDC. A 0.8ms soft-start delay is applied when the EN_N pin is toggled Low, and the USBIN 50ms debounce period has expired.

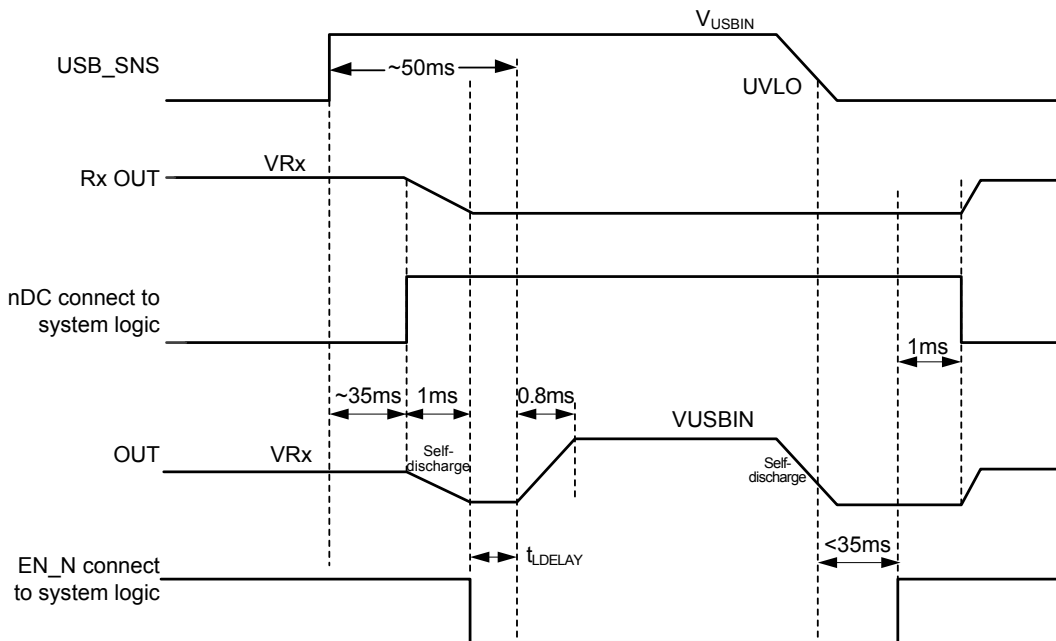

Figure 8. Slave Mode Timing (with Battery Present): Dual Input with USBIN Insertion and Removal (Assumes FLAG_N = low, RX_N = Low)

OPERATION (continued)

In autonomous mode, a 50ms debounce delay, 50ms break-before-make/discharge period and a 0.8ms soft-start delay are applied when the USB_SNS input is rising threshold is detected. The FLAG_N pin provides

the USBIN voltage status prior to entering OTG mode. The discharge feature is enabled during the 50ms break-before-make period.

Figure 9. Autonomous Mode Timing: Dual Input with USBIN Insertion and Removal (Assumes EN_N = low)

OPERATION (continued)

In OTG modes, a load is applied to the USBIN and current flow from OUT to USBIN.

In slave mode, OTG occurs when a valid OUT voltage is applied, no voltage is detected at the USB_SNS and the t_{LDELAY} debounce time is satisfied. OTG mode is triggered by pulling the EN_N pin low, as shown in Figure 9.

In autonomous mode, the FLAG_N is a logic output and toggles high to indicate USBIN invalid, and OTG can be enabled immediately. The FLAG_N pin is bidirectional, and autonomous OTG mode is triggered by pulling the FLAG_N input pin low, which triggers a soft start.

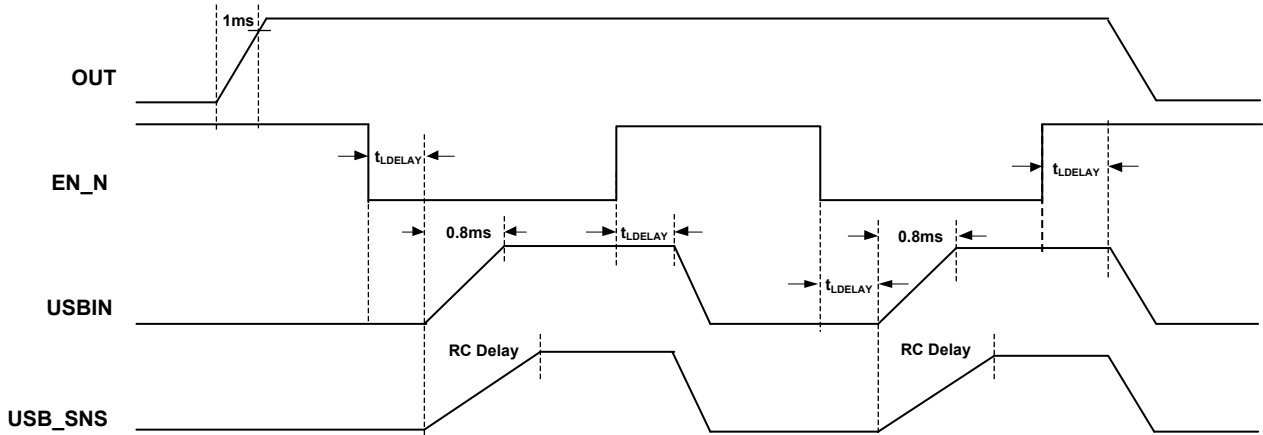

Figure 10. Slave OTG Mode Timing: OTG Activate and Deactivate (Assumes FLAG_N = low, RX_N = low)

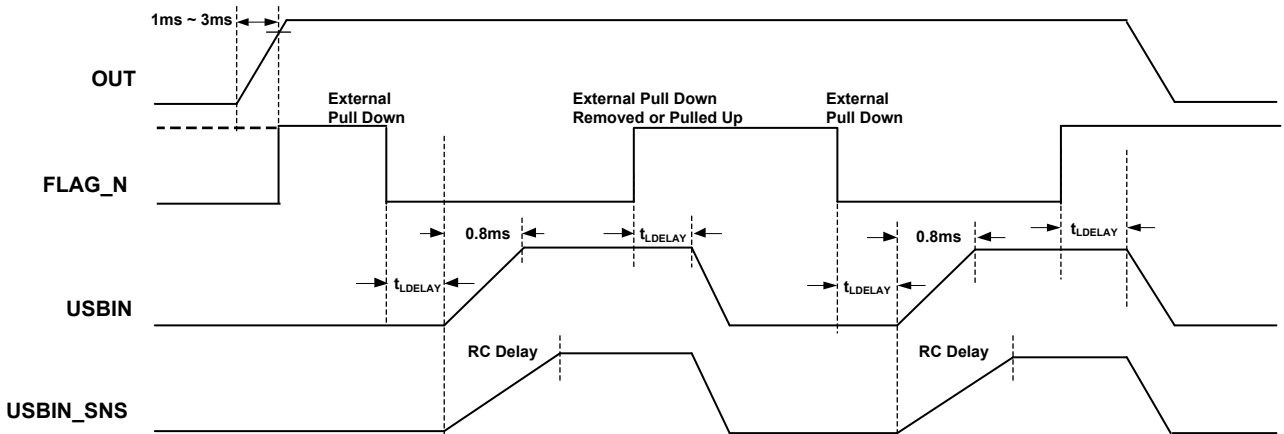

Figure 11. Autonomous OTG Mode Timing: OTG Activate and Deactivate (Assumes EN_N = low)
